## **Lab Manual 4**

“Data Retrieval Select-from-where, Joins”

### **Database Systems Lab**

Spring 2023

Department of Computer Science  
FAST-NU, Lahore, Pakistan

## Contents

1. Objective	2
2. Pre-requisites	2
3. SELECT-FROM-WHERE	3
Most Basic Select:	3
Retrieving certain Columns from Select	4
Retrieving certain Rows from Select- WHERE CLAUSE	4
Renaming Resulting Column	5
4. Order by Clause	5
TOP Clause	6
5. Join Operation	6
Inner Join:	6
Left/Right/Full Outer Join	7
Cross Join	8
Joining More than two tables	8
Self Join	8

## 1. Objective

- This manual aims to get started with data retrieval queries, starting from Simple Select-From-Where, going towards Join operations.

## 2. Pre-requisites

- Lab 2,3 manual, on how to get started with MS-SQL server
- How Select From Where clause work

Task Distribution

Total Time	170 Minutes
Select from where	15 Minutes
Order by	15 Minutes
Joining	15 Minutes
Exercise	125 Minutes

### 3. SELECT-FROM-WHERE

Select from where is equivalent to projection and selection in Relational Algebra, it will give output in form of a table.

The most basic select statement includes Select and from clause, and it will retrieve all columns and rows from the table.

We will use the following schema and database for the examples. Script to create this schema is given in Lab4Manual.sql file

Students

StudentID	StudentName	StudentBatch	CGPA
1	Ali	2013	3.3
2	Aysha	2013	4
3	Ahmed	2013	2.2

Instructors

InstructorID	InstructorsName
1	Zafar
2	Sadia
3	Saima

Courses

CourseID	CourseName	CourseCreditHours	InstructorID
1	Computer Programming	3	1
2	Computer Organization	3	2
3	Computer Programmi...	1	NULL

Registration

StudentID	CourseID	GPA
1	1	3
1	3	3
2	2	0

#### Most Basic Select:

```
SELECT *
FROM <tableName>
```

\* after select means that all columns will be retrieved

Try this

Results

## Retrieving certain Columns from Select

To retrieve only certain columns give a comma separated list of those columns after Select keyword

```
SELECT ColumnX, ColumnY, ColumnZ  
FROM <tableName>
```

Try this

Results

## Retrieving certain Rows from Select- WHERE CLAUSE

Like Selection in RA, rows are filter in SQL using WHERE clause, rows that fulfill where clause conditions will be projected in result. Where clause can put condition on original columns of tables mentioned on from clause, or derived columns.

```
SELECT *  
FROM <tableName>  
where <conditions>
```

Try this

Results

## Renaming Resulting Column

You can rename a column in result by using AS keyword also called Alias. The scope of this renaming is only to that select query, this is useful in joining where more than one table have same column names.

```
SELECT ColumnX as X , ColumnY as Y, ColumnZ  
FROM <tableName> as Table1
```

Try this

Results

## 4. Order by Clause

Order by clause is used to arrange the rows in ascending or descending order of one or more columns

```
SELECT ColumnX as X , ColumnY as Y, ColumnZ  
FROM <tableName> as Table1  
ORDER BY ColumnX asc/desc, ColumnZ asc/desc
```

Try this

Results

## TOP Clause

Top n clause will give you first n rows from result instead of all the rows.

```
SELECT TOP <n> *  
FROM <tableName>  
where <conditions>  
Order by <column Name> asc/desc
```

Try this

## 5. Join Operation

We will use the following tables in examples

### Inner Join:

Returns only those rows that match in both tables.

```
SELECT *  
FROM <table1> inner join <table2>  
ON <Joining Condition>
```

```
select * from Instructors
inner join courses
on Courses.InstructorID=Instructors.InstructorID
|
```

	InstructorID	InstructorsName	CourseID	CourseName	CourseCreditHours	InstructorID
1	1	Zafar	1	Computer Programming	3	1
2	2	Sadia	2	Computer Organization	3	2

## Left/Right/Full Outer Join

Left Join: Returns all the rows of Left table with corresponding row or null row of right table

Right Join: Returns all the rows of Right table with corresponding row or null row of Left table

Full Join: Union of Left and Right Outer join

SELECT \* FROM <table1> Left/Right/Full join <table2> ON <Joining Condition>

Try these

## Cross Join

It's a cross product of two tables, no ON condition is required here

```
SELECT * FROM <table1> cross Join <table2>
```

Try this

## Joining More than two tables

```
SELECT *  
FROM <table1>  
Left/Right/Full/Inner join <table2> ON <Joining Condition>  
Left/Right/Full/Inner join <table3> ON <Joining Condition>
```

Try this

```
Left/Right/Full/Inner join <table4> ON <Joining Condition>
```

## Self Join

A self join is a regular join, but the table is joined with itself.

```
SELECT column_name(s)
FROM table1 as T1, table1 as T2
WHERE condition
```
